(54) **TWISTING WIPER ARM**

(57) Abstract:

PURPOSE: A twisting wiper arm is provided to prevent a wiper blade from being lifted during high speed traveling, and to drive safely by forming the twisting angle of 90 degrees between a link installation part and a blade installation part.

CONSTITUTION: A wiper arm(20) is composed of a link installation part(22) combined with a wiper link operated by a wiper motor through a pin hole(22a), and twisted around a first twisting point (P1); a blade installation part(26) mounting and turning a wiper blade(40) around a pin(32) by a holder(30); and a connecting part (24) connected to the link installation part and the blade installation part, and twisted around a second twisting point(P2). The blade installation part is oriented against the plane of the link installation part at the angle of 90 degrees with first and second twisting points. Safe driving is performed by preventing lifting of the wiper blade during traveling at high speed.
